dDAGroot

Function to find the root node of a direct acyclic graph (DAG)

Description

dDAGroot is supposed to find the root node of a direct acyclic graph (DAG; an ontology). It return the name (i.e Term ID) of the root node.

Usage

```
dDAGroot(g)
```

Arguments

g an object of class "igraph" or "graphNEL"

Value

- root: the root name (i.e. Term ID)

Note

none
